

Describe a skin problem in plain language and MediSense returns a ranked differential, the next test, a screened first-line treatment, and a conversational explanation you can question. Two engines: a grounded knowledge base decides the medicine; Gemini writes the words.

Every answer is a suggestion with its reasoning attached — the physician confirms the decision. Illustrative demo, not for real patient care.

01 THE FORMULA

Give it three things

Plain words work — it maps everyday terms to clinical ones.

[what the lesion looks like] + [where on the body] + [how long] (+ optional: age · itch/pain · triggers like sun or contact)

English or 中文 both work. Tap any prompt below to copy it.

YOU CAN SAY...	IT UNDERSTANDS...
silver / flaky / peeling	silvery scale
blackheads / whiteheads / pimples	comedones · papules · pustules
ring-shaped / ringworm	annular lesion
shiny bump, tiny blood vessels	pearly papule · telangiectasia
golden crusty sores	honey-coloured crusts
a mole with uneven edges/colours	asymmetry · irregular border

Copy-paste example prompts

Each one produces a strong, correct answer. Click to copy.

● Inflammatory / eczema

- > red thick scaly patches with silvery flakes on my elbows and knees for 3 months
- > itchy dry eczema in the elbow and knee creases of a child, keeps coming back
- > red itchy blistery rash exactly where my watch strap touches my wrist

● Infections

- > ring-shaped itchy rash with a clear middle and scaly edge on the trunk
- > kid with golden crusty sores around the mouth that are spreading
- > painful cluster of blisters on the lip that keeps coming back same spot

● Acne / rosacea

- > blackheads, whiteheads and pus pimples on a teenager's oily face
- > severe nodulocystic acne with deep painful lumps and scarring stronger Rx tier
- > persistent central facial redness with flushing and broken vessels, no blackheads

● Hives & bilingual

- > itchy hives and welts that come and go within a few hours
- > 胳膊肘上有红色斑块，上面有银白色皮屑 → 银屑病
- > 脸上有黑头白头和脓疱，油性皮肤 → 痤疮

● Skin-cancer / do-not-miss — triggers a safety banner

> a mole on my back that changed – uneven edges, two colours, and got bigger → Melanoma

> a slowly growing shiny pearly bump on the nose with tiny blood vessels that won't heal → BCC

> rapidly growing crusted ulcerated lump on the sun-damaged lip of an elderly man → SCC

> painful mouth sores and flaccid blisters, skin peels when rubbed → Pemphigus

These surface a red banner: "Possible skin malignancy — prioritize dermatology referral and biopsy."

03 KEEP CHATTING

Ask follow-ups — it remembers the case

After the first answer, just keep typing. Click to copy.

Why psoriasis and not eczema?

Is any of that treatment unsafe in pregnancy?

What's the dose again?

What else should I check?

Which differentials should I rule out?

Explain that more simply.

REAL EXCHANGE

You — Why psoriasis and not eczema? And is any of that treatment unsafe in pregnancy?

MediSense — Psoriasis presents with silvery scales on well-demarcated plaques on extensor surfaces like elbows and scalp; eczema has less distinct borders. On pregnancy: **Tazarotene is contraindicated**; Calcipotriol and Betamethasone are generally safer — confirm with the obstetrician and pharmacist.

A 3-minute demo script

1 Classic case → red thick scaly silvery patches on elbows and scalp for 3 months

Show: ranked differential + treatment card with doses and the pregnancy safety flag.

2 Follow-up → Is any of that treatment unsafe in pregnancy?

Show: it answers in context, grounded in the safety data.

3 Safety → a mole that changed – uneven edges, two colours, got bigger

Show: the red-flag banner → referral & biopsy (Melanoma).

4 Bilingual → 脸上有黑头白头和脓疱，油性皮肤

Show: a full answer in Chinese (寻常痤疮 / acne).

5 Safe by design → itchy red rash (deliberately vague)

Show: it asks for morphology, location, and duration instead of guessing.

05 GOOD TO KNOW

What to expect

scope ~25 dermatology conditions — inflammatory, infections, acne/rosacea, pigmented lesions & skin cancers, bullous, drug eruptions. Best for skin cases.

vague in **Too little detail?** It asks for the lesion shape, location, and duration rather than guessing a diagnosis.

off-topic **Non-skin input** (e.g. chest pain) is outside the dermatology demo's scope.

ai wording **Gemini free tier** can momentarily hit its quota — the diagnosis, doses, and safety still show; only the conversational phrasing falls back to plain text.

languages **English / 中文** — describe the case or ask follow-ups in either.

MediSense · assist, never replace — the physician confirms every diagnosis and prescription.
